

Unified Communications

Hosted Cisco Unified Communications Manager 6 Business Edition (Hosted Cisco UC6 BE)

Cisco Unified Communications Manager 6 Business Edition is a comprehensive IP communications system which enables more effective, more secure and more personal communications that directly affects both sales and profitability.

The Hosted Cisco UC6 BE is designed for businesses with up to 500 employees and up to 5 remote sites. It consolidates all of the communications applications that a business will need onto a single 1U high server, including; Cisco Unity Connection 2.0 which is Voice Messaging with Personal Web Administration, and Cisco Unified Mobility which provides the capability to have up to four devices ring when a call comes into a user's IP phone.

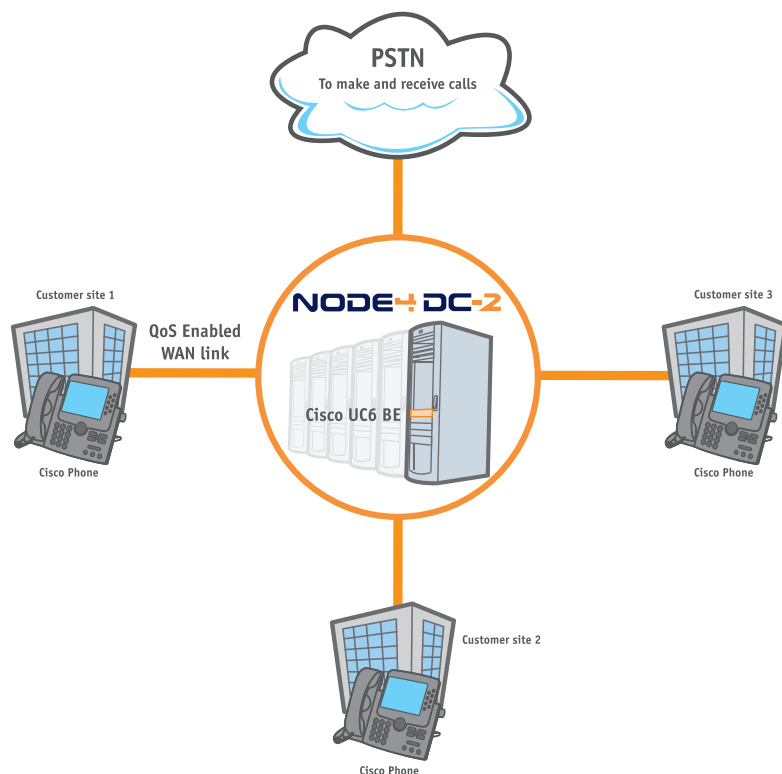

The growing organisation is also supported with multiple expansion options with extensions and sites added quickly and easily until the maximum numbers are reached.

Centralising the Cisco UC6 BE by hosting the server in Node4's DC2 gives businesses access to the latest in IP communications without the hassle of implementing and managing it themselves.

Sites are connected using Node4's connectivity which will guarantee voice quality. A multi-site business appears as one with the ability to transfer calls between sites for free, along with providing many features that will improve productivity for any mobile employees, including a single voice mailbox and a single-number reach application.

Phone lines at each site are not required as breakout to the PSTN is also accessed centrally via Node4's Data Centre.

The solution includes many features specifically designed for the SME, including do not disturb and audio message waiting indicators, but the business will also have access to traditional enterprise features such as speech recognition and integrated messaging.

Features & Benefits:

- All applications built onto one server saves money and space for businesses. In addition to saving money, using less equipment and power also helps to save the environment
- Call Admission Control helps ensure that voice quality of service is maintained across Wide Area Network (WAN) links
- Session Initiation Protocol (SIP) support is available on the Cisco UC6 BE
- Personalized voice messaging for each individual employee.
- Fully managed service with on-hand technical support
- Free geographic and non-geographic numbers provided by Node4
- Free calls between sites and highly competitive external call rates
- 0% finance available subject to status.
